# Vendor-Independent modeling and exchange of Fieldbus Topologies with AutomationML

**Markus Rentschler**, Balluff GmbH, Germany

Prof. Dr. Rainer Drath, University of Applied Sciences Pforzheim, Germany

Matthias Mueller, Mitsubishi Electric Europe B.V., Germany

## 1. Problem Statement

- Device Engineering & Lifecycle
- Lack of instance data handling
- Lack of modelling capabilities
- The standardization deadlock

## 2. Proposed Solution

- AML-Device Descriptions (AML-DDs)
- AML-DD File Packages
- Topology Descriptions

## 3. Practical Example

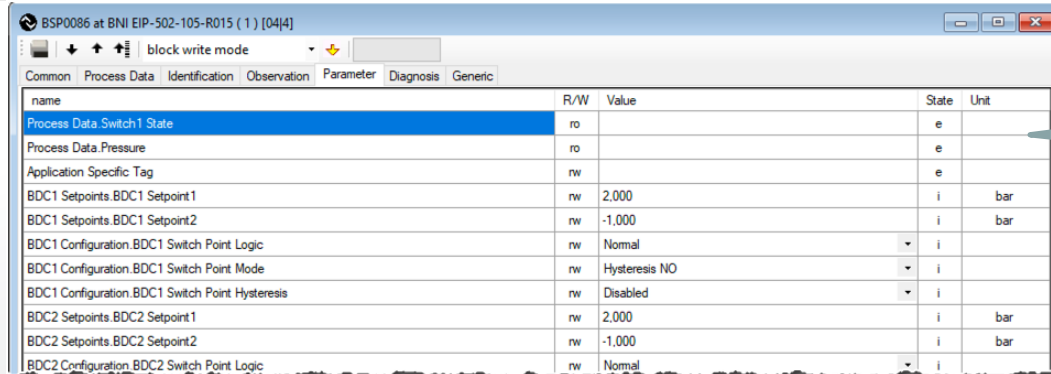

## 4. Conclusion

The **Device description (DD)** models a static device type with its properties and parameters

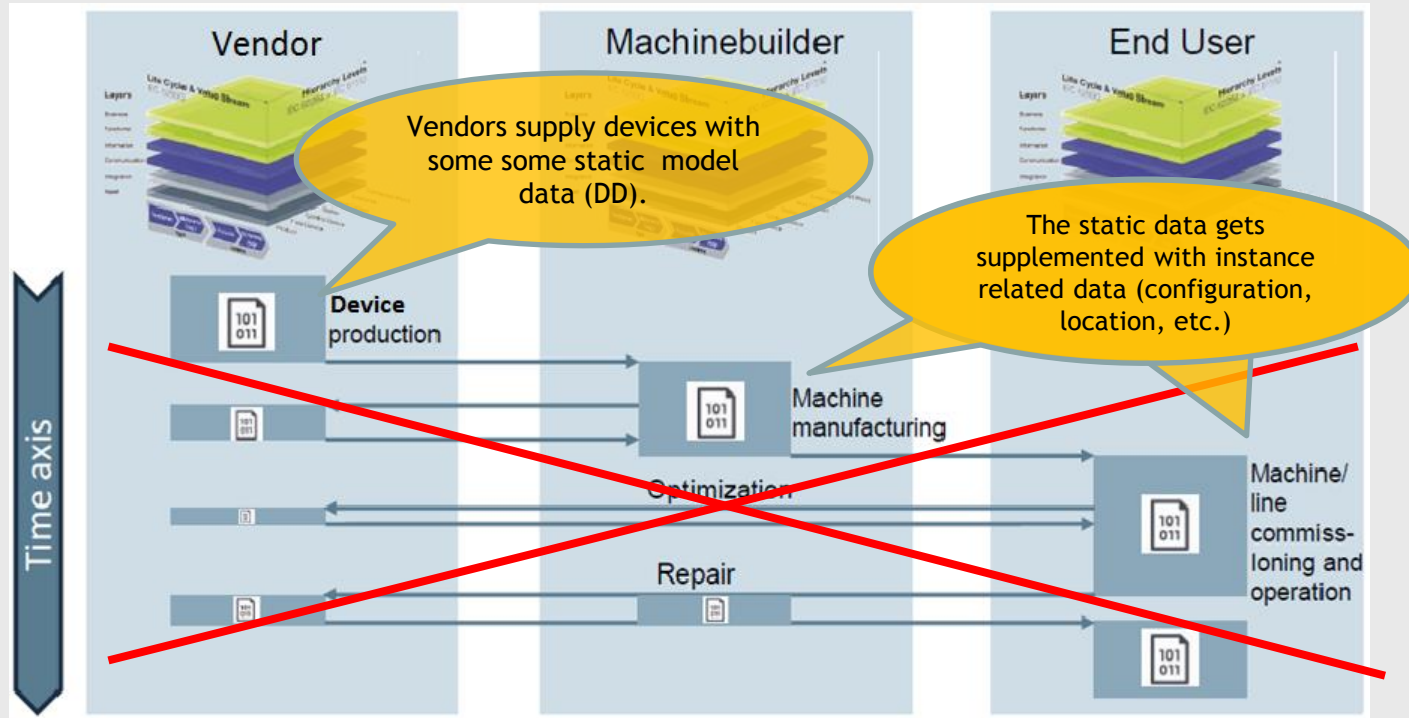

- e.g. ESD (Ethernet/IP), ESI (EtherCAT), GSD (Profinet), XDD (Powerlink), CSP+ (CC-Link), IODD (IO-Link)

name	R/W	Value	State	Unit
Process Data.Switch1 State	ro		e	
Process Data.Pressure	ro		e	
Application Specific Tag	nw		e	
BDC1 Setpoints.BDC1 Setpoint1	nw	2,000	i	bar
BDC1 Setpoints.BDC1 Setpoint2	nw	-1,000	i	bar
BDC1 Configuration.BDC1 Switch Point Logic	nw	Normal	i	
BDC1 Configuration.BDC1 Switch Point Mode	nw	Hysteresis NO	i	
BDC1 Configuration.BDC1 Switch Point Hysteresis	nw	Disabled	i	
BDC2 Setpoints.BDC2 Setpoint1	nw	2,000	i	bar
BDC2 Setpoints.BDC2 Setpoint2	nw	-1,000	i	bar
BDC2 Configuration.BDC2 Switch Point Logic	nw	Normal	i	

DD's allow representation of the device properties in a proprietary engineering tool

Additional model data is often  
available in separate files, in  
distributed locations and different  
versions

# Goal: DD with full model for the Digital Twin, "Asset Manifest" for I4.0-Component

DD Standard today

DD Standard tomorrow

**Let's extend the DD standard!**

- requires a new version of the legacy DD standard
- requires extensive standardization cycles within the fieldbus communities
- breaks compatibility with the existing tool landscape

How can we extend a DD standard without changing it?

## New Idea: Extend the classical DDs with AML

### Embedding the existing DD standard into the AutomationML standard

- The legacy DD remains unchanged
- The existing tool landscape can remain unchanged.
- Extended features can be added stepwise into the tool landscape.
- The DD standard elegantly inherits all object oriented capabilities of AutomationML.

# Summary on AML-DDs

The AML-DD concept is generic

- thus a truly next generation device description
- able to model type and instance information
- starting point for exchangeable 360° models of devices with documents, icons, 3D models, function blocks, faceplates etc.
- Provides a migration path!

# Description of topology information

1. A given topology of devices exists.
2. Each device comes with an AML-DD that describes the physical (and logical) device interfaces
3. CAEX provides the “InternalLink” element to connect interfaces, even between different AML files.
4. The links between the interfaces in the AML-DDs are described in an AML-Topology file.
5. The AML-DDs are referenced from the AML-Topology file via the “ExternalInterface”-Element.

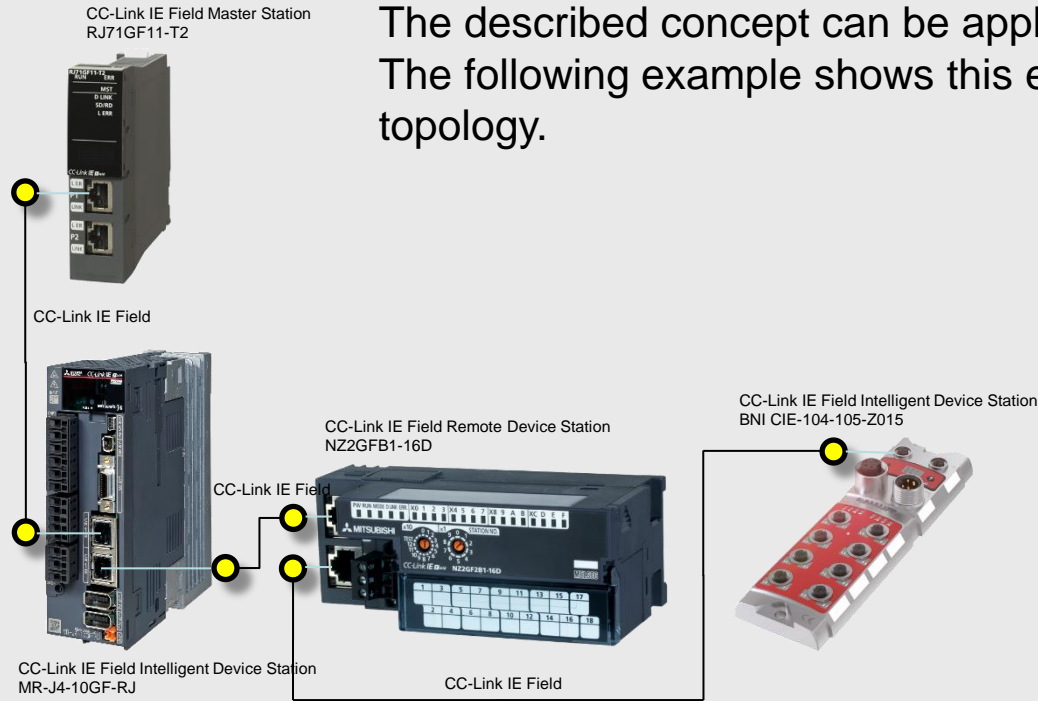

# Description of mixed technology systems

Source: Balluff

# CC-Link IE Field Sample Description

The described concept can be applied to any field bus technology.  
The following example shows this exemplary for CC-Link IE Field network topology.

- Step 1:  
Developing technology specific role classes
- Step 2:  
Modelling of CC-Link IE Field devices and masters in AutomationML
- Step 3:  
Modelling the CC-Link IE Field topology

# Developing technology specific role classes

```
ExampleCCLinkIEFieldRoleClassLib
  CCLinkIEFieldDeviceDescriptionFile {Class: ExternalData }
  CCLinkIEFieldMaster {Class: PhysicalDevice }
  CCLinkIEFieldSlave {Class: PhysicalDevice }
  CCLinkIEFieldLogicalSlave {Class: LogicalDevice }
  CCLinkIEFieldPhysicalPortList {Class: PhysicalEndpointlist }
  CCLinkIEFieldLogicalMaster {Class: LogicalDevice }
  CCLinkIEFieldLogicalPortList {Class: LogicalEndpointlist }
  CCLinkIEFieldLogicalNetwork {Class: LogicalNetwork }
```

Defining technology specific role classes which are derived from role classes of the CommunicationRoleClassLib

```
ExampleCCLinkIEFieldInterfaceClassLib
  CCLinkIEFieldLogicalEndPoint {Class: LogicalEndPoint }
```

Defining technology specific interface class which are derived from a interface class of the CommunicationInterfaceClassLib

# Modelling of CC-Link IE Field devices and masters in AutomationML

# Modelling the CC-Link IE Field topology

- **Engineering of Automation Systems is traditionally based on proprietary Device Description Languages and associated software tools, usually defined by fieldbus organizations.**
- **These systems lack of many capabilities and extending them is difficult, because the fieldbus organizations are very restrictive.**
- **AutomationML based on CAEX is a simple but powerful means to “extend” and finally even replace these legacy Device Descriptions without changing them.**
- **The way to get acceptance for such a method within the industry is standardization by an accepted body within the automation community and a migration path for the legacy systems because of investment protection!**
- **In a cooperation between the IO-Link-Consortium and the AutomationML association currently the first standard is defined for the IO-Link infrastructure.**
- **Because the underlying concept is generic, it can easily be adapted by any fieldbus organization.**

DD standards can be extended without changing them! 😊

**Thanks for your attention!**
